```

e `for` → unrolled **f** range → iteration count, from lines 4–5 **b** gate **c** qubit argument → a qubit per iteration *angle . . .* elided, kept symbolic

② Unrolled operations in the slice of q_0

line 12, `ry`	line 13, `rz`	line 15, `cx`
5 of 6	**5** of 6	**3** of 4

Filled squares are in the wire slice of q_0, 13 of 16 operations. The lines are the same in every iteration, but in the second layer the rotations of q_2 and its `cx` are not dependences of q_0; a line-level slice keeps lines 12, 13 and 15 anyway.
